VIRGINIA BREAST CENTER
Named Reference Center by Sanarus Medical

Sanarus Medical today announced a partnership with Virginia Breast Center to increase the awareness and availability of an innovative, non-surgical treatment option for women with benign breast tumors, known as fibroadenomas.

Only a select few sites across the nation are trained and appointed as reference sites to provide this innovative treatment, which involves the cryoablation, or freezing, removal of fibroadenomas. Prior to the existence of this treatment, open surgery was the only option for women with benign breast tumors. The innovative Visica 2™ System uses liquid nitrogen as the freezing agent and the procedure is completed in the doctor's office, usually in less than an hour. The original Visica® Treatment System received FDA market clearance in 2002 and has been proven highly safe and effective with more than 1,500 fibroadenomas treated.

Sanarus Medical is based in Pleasanton, California and is focused on providing patients and physicians with minimally invasive, office-based breast care management solutions from diagnosis and treatment to follow-up. The company's website is <http://www.sanarus.com>.

Virginia Breast Center is a full-service surgical diagnosis and treatment and women's imaging facility located in the Bon Secours Cancer Institute building in Midlothian, on the campus of St. Francis Medical Center. Drs. James Pellicane and Polly Stephens specialize exclusively in the diagnosis and treatment of breast disorders, both benign and malignant. For more information, call (804) 594-3130 or see Virginia Breast Center's website at <http://vabreastcenter.com>.
